USEFUL INFORMATION

BASIC WEIGHT:

The weight of one ream or 500 sheets of the base size.

EQUIVALENT WEIGHT:

The weight of one ream or 500 sheets, of other sizes larger or smaller than the basic size.

SHEET AREAS OF BASIC SIZES

KIND OF PAPER	SQUARE INCHES	BASE SIZE
Bonds, Ledgers, Thin papers		
Writings	374	17x22
Cover Papers	520	20x26
Blanks	616	22x28
Printing Bristols	641	22.5x28.5
Kraft, Newsprint	864	24x36
Book Papers, Offset, Text	950	25x38
Index	778	25.5x30.5

HOW TO FIND THE EQUIVALENT WEIGHT

Formula:

Length x width of sheet size x basic weight, divided by length x width of basic size, result is the equivalent weight.

Example:

What is the weight of a 32 pound ledger paper size 28 x 34?

Solution:

Filling in the known factors in the formula, the following equation is obtained – 952×32 divided by 374, which equals 81.4 the equivalent weight. Thus 28 x 34 - 81 lb., is equal to 17 x 22-32 lb. or one ream of the 32 lb. paper in size 28 x 34 weight 81 lbs.

JP GOULD

USEFUL INFORMATION

HOW TO FIND THE WEIGHT OF AN ODD NUMBER OF SHEETS

Formula:

Weight of 1000 sheets x number of sheets divided by 1000 results in total weight.

Example:

What is the weight of 1475 sheets of 17 x 22-28 lb. stock?

Solution:

Filling in the formula:

2 x 28 x 1475 divided by 1000 equals 82.6 lbs.

The 1475 sheet weight 82.6 lbs.

HOW TO FIGURE BASIS WEIGHT

When sheet size and ream weights are known.

Formula:

Length x width of basic sheet size x ream weight divided by length x width of sheet size results in basis weight.

Example:

What is the basis weight of a ream of book paper sheets 23 x 29 weighing 56 lbs. Per ream?

Solution:

25 x 38 x 56 divided by 23 x 29 equal 5350 divided by 667 equals 80 lb. basis weight.

HOW TO FIGURE REAM WEIGHT

When sheet size and basis weights are known.

Formula:

Length x width of sheet x basis weight divided by length x width of basic sheet size equals weight per ream.

Example:

What is the ream weight of sheets of 20lb basis weight bond paper 22 x 25 ½?

Solution:

22 x 25 ½ x 20 divided by 17 x 22 equals 1122 divided by 374 equals 30 lbs. per ream.

HOW TO FIGURE PIECES PER SHEET

Formula:

Place the dimensions of the size desired under the dimension of the sheet, then divide both vertically and diagonally. The larger of the two whole numbers is the answer.

Example:

How many 5 x 8 cards can be cut from a 25 ½ x 30 ½ sheet?

DIVIDE VERTICALLY

25 ½ x 30 ½

5 x 8

5 x 3 equals 15 cards

THEN DIAGONALLY

25 ½ x 30 ½

5 x 8

6 x 3 equals 18 cards

DETERMINATION OF THE NUMBER OF YARDS IN A ROLL OF PAPER

The approximate number of lineal yards in a roll of paper may be calculated from the following formula:

$$A \text{ equals } \frac{B \times 13,194}{C \times D}$$

Where,

A equals lineal yards

B equals weight of roll in inches

C equals width of roll in inches

D equals basis weight

Example: A roll of 60 lb. paper (25 x 38 – 500) 50 inches wide weighing 4000 lbs.
4000 x 13,194 equals 17,592 yards.

The above calculation was based on the nominal basis weight. Variations in basis weight in actual practice will cause the yardage to vary slightly.

JP GOULD

USEFUL INFORMATION

FORMULA FOR COMPUTING THE WEIGHT OF A ROLL WHEN THE DIMENSIONS AND BASE WEIGHT ARE KNOWN.

The approximate weight of a roll of paper may be computed from the following formula:

A equals $(B \times 2 - C \times 2) DE$

Where,

- A equals weight of the roll in pounds
- B equals diameter of the roll in inches
- C equals diameter of the core in inches
- D equals width of the roll in inches
- E equals factor as per table below

FACTORS

Regular Offset	.023	Pigmented papers	.026
Antique Offset	.018	Hi bulk papers	.016
E F Book	.027	Bible papers	.024
Eggshell Book	.018	Coated papers	.033

Example: Find the weight of a roll of regular finish paper, 50 inches wide wound on a 3 inch core.

Weight of roll equals $(50^2 - 3^2) \times 50 \times .023$
Equals $(2500 - 9) \times 50 \times .023$
Equals $2491 \times 50 \times .023$
Equals 2864 lbs.

HOW TO DETERMINE THE NUMBER OF REAMS THAT CAN BE SHEETED OUT OF A GIVEN ROLL OF PAPER.

To determine the number of reams of a given size and weight that may be sheeted out of a roll of paper, divide the weight of the roll by the weight of the ream. This will be only approximate as the weight of the core, plugs and normal trimming losses are not taken into consideration.

Example:

Roll weight 1185 lbs.
Ream weight $25 \times 38 - 45/500$
 $1185/45$ equals 26.3 reams

METRIC SYSTEM

Here are a few points to help you interpret the metric system as it pertains to printing papers.

1. Paper sizes are expressed in millimeters (mm).
2. Basis weight is expressed in grams per square meter (g/m^2).
3. Total weight is expressed in kilograms or metric tons.

To convert: Pounds to kilograms – multiply by .4536
Pounds to metric tons – multiply by .0004536
Tons to metric tons – multiply by 1.102

To convert from inches to millimeters – multiply by 25.4

METRIC SYSTEM (cont.)

Converting basis weight:

To convert basis weight to grams per square meter (gms):

	(Basis Weight) (1406.5)
	Basic Size (in. ²)
Basic sizes	
Writing	17 x 22 = 374 sq. in.
Text/Offset	25 x 38 = 950 sq. in.
Cover	20 x 26 = 520 sq. in.
Tag	24 x 36 = 864 sq. in.

Example: 80 lb. cover

$$\frac{(80) (1406.5)}{20 \times 26} = \frac{112,520}{520} = 216 \text{ gsm}$$

To convert grams per square meter (gms) to basic weight:

$$\frac{(\text{gms}) (\text{Basis Size [in.²])}{1406.5}$$

Example: 104 gsm. What basis eight is 104 gsm equivalent to in Text/Offset?

$$\frac{(104) (25 \times 38)}{1406.5} = 70\# \text{ Text/Offset}$$

How to determine pieces per sheet.

Write down the sheet size that you are cutting down. Under that, write down the desired sheet size. Divide both vertically and diagonally. The larger of the two numbers, disregarding fractions, is the number of sheets with the least amount of waste.

Example: How many 4 x 9 sheets can be cut from a 19 x 24 sheet?

Divide:

Vertically

$$\begin{array}{r} 19 \times 24 \\ \hline 4 \times 9 \\ \hline 4 \times 2 = 8 \text{ out} \end{array}$$

Diagonally

$$\begin{array}{r} 19 \times 24 \\ \hline 4 \times 9 \\ \hline 6 \times 2 = 12 \text{ out} \end{array}$$

GRADE DIFFERENTIATION OF COATED SHEETS

Coated grades of paper are assigned grade numbers 1-5 based mainly on brightness levels. The higher grades, numbers 1-3, contain only pulp made using a chemical process that removes the lignin from the wood pulp. (Lignin is the natural “glue” that holds the fibers together in the tree and tends to darken the color of the pulp.) This type of chemical pulp is referred to as “kraft” which is the German word for strong because it provides good strength characteristics to the finished paper. The pulp is then bleached to a specified brightness level. These types of papers are sometimes called free sheets or wood free grades.

Grades 4 and 5 contain some kraft, but also contain pulp made using a mechanical process which is usually referred to as groundwood, although it can be manufactured in a number of different ways. The lignin remains with the pulp and therefore it can not be bleached economically to the same brightness levels of kraft pulp. These grades are usually called groundwood papers.

The brightness level of coated grades is dependent on the blend of fiber (pulp) types as well as coating make-up. These materials are balanced to produce a product which is designed to meet customer expectations for both runnability and print quality.

GRADE DIFFERENTIATION OF UNCOATED SHEETS

The uncoated grades of paper also contain a combination of kraft and mechanical pulp, with the exact percentages of each determined by the end use, brightness requirements, and cost constraints. Normally, the SC grades would have the highest kraft content, followed by directory paper and newsprint. These grades also contain fillers such as clay, talc, and other mineral type materials, which provide sheet density, brightness, and smoothness. The SC grades would have the highest level, followed by the directory and newsprint grades. The amount of filler is sometimes referred to as ash content.

HANDLING PAPER IN THE PRESSROOM

TEMPERATURE CONDITIONING*

Temperature conditioning means that the paper is stored in the plant and is not unwrapped until it reaches the same temperature as the pressroom where it will be used. Required storage time depends on the size of the skid, carton or rolls and its temperature on arrival. Do not remove or tear the wrapper during storage. Seal rips and holes with tape. To know how long paper should stand before you unwrap it, determine the following two figures and consult the chart.

FIRST: Determine the difference in the paper's temperature and the temperature of the room where it will be unwrapped.

Cut a small slit in the wrapper and insert a thermometer into the pile. (When you remove it, seal the slit with tape.) If you cannot do this, use the outdoor temperature when the paper arrived as the paper's temperature.

SECOND: Determine the cubic volume of the skid, carton or roll.

For the cubic foot volume of paper on a skid or case, multiply length x width x height (in inches) and divide by 1,728. For the volume of roll paper in cubic feet, multiply roll diameter x roll diameter x roll length (all in inches) x 3.14 and divide by 6,912.

If a calculation for cubic feet falls between two numbers in the chart, use the next higher number in the chart. Example: If the volume is 32 cubic feet, use the number of hours on the 48 cubic feet line (in the chart below).

Cold paper in a warm room chills the air around the pile and raises its relative humidity. Uncovered edges of paper quickly pick up moisture. Sheet paper edges become wavy; roll paper edges become slack. Moisture condenses on very cold paper as it does on a glass of ice water. As the paper warms up, some but not all of the moisture is given off. Waviness or slackness will be reduced but will not disappear with normal conditioning.

PAPER TESTING

BASIS WEIGHT

The designation given to a sheet of paper in terms of weight of 500 sheets (one ream) in the standard size for that grade: Offset – 25” x 38”; Reprographic – 17” x 22”; Tag – 24” x 36”; Vellum Bristol 22 ½ “ x 28 ½ “.

Example:

The basis weight of a typical grade of reprographic paper is 20 lb. Bond (indicating 500 sheets, 17” x 22” weighing 20 pounds)

CALIPER

The caliper (or thickness) of paper at a given basis weight determines its bulk and is affected by processing done to get smoothness and porosity. Variations in caliper across the sheet will cause problems such as loose edges, baggy areas and misregister.

Caliper is measured by a micrometer having a foot diameter of 5/8” that is clamped against the sheet at a pressure of 7 psi. Results are reported in ten-thousandths (.0001) of an inch.

A caliper reading is usually the average of several tests across the sheet.

SMOOTHNESS

The smoothness is a measure of paper surface irregularities. This property affects many end uses, particularly the appearance of printing. The test is conducted by clamping the paper against a flat surface and measuring the rate of airflow passing between the two surfaces.

The Sheffield Instrument is the most commonly used and a higher number indicates a rougher sheet. Some typical smoothness values are: 10 – 30 for very smooth coated paper; 100 – 150 for smooth offset and 200 – 250 for Vellum offset.

POROSITY

Porosity is an indication of the openness of paper, as measured by resistance to the passage of air through the sheet.

Two types of instruments are generally used to measure porosity: Gurley and Sheffield. The Gurley Instrument measures the seconds required for a given volume of air to pass through a single sheet of paper and is generally used for porous papers. A high reading indicates a less porous (more dense) paper. A typical Gurley porosity test for 50lb. smooth offset is 10 – 20 seconds. Sheffield porosity measures the flow rate of air through a single sheet and is generally used for a non-porous or dense sheet. A high Sheffield reading indicates a more open paper. A typical Gurley porosity test for 50 lb. smooth offset is 10 – 20 seconds. Sheffield readings for 60 lb. coated paper would be 10 – 20 units of airflow.

NEKOOSA COATED PRODUCTS,LLC**Thermanent & Indigo Synthetics**

Thermanent designed to withstand the high heat environment within toner-based digital printing equipment, Thermanent is a premium polyester based synthetic that combines extreme strength, flexibility, print quality and durability. This revolutionary product produces beautiful images that last when hung on the wall or even submerged in water. Strength and durability make Thermanent the perfect substrate to replace any laminated application including signage and menus. Nekoosa now offers die cut templates for door hangers, parking passes, and business cards. This product is offered in convenient retail size reams containing 100 sheets for most sheet sizes, which make those smaller jobs a perfect match for your digital printer. Why waste time and money laminating when you can press the green print button on your digital printer and have a job that is ready to ship using Thermanent?

- Designed specifically for digital toner platforms ranging from desktop printers to full production digital equipment.
- Replaces laminating. Durable and weather resistant polyester face stock is perfect for indoor and outdoor usage.
- Available in three die cut patterns; 3UP door hangers, 6UP parking passes and 8UP ID cards to save you time and money.

Nekoosa's Indigo Durable Synthetic, with premium IndiLuxe™ coating, is a synthetic paper specifically designed for HP Indigo presses. Its durable, tear resistant base stock makes Indigo Durable Synthetic a great choice for both indoor and outdoor applications where resistance to water, chemicals, oil and grease is necessary.

Advantages:

- Earned top ratings in all HP Indigo certification categories from the Rochester Institute of Technology
- Excellent HP Indigo ElectroInk® adhesion for superior imaging
- Nekoosa's IndiLuxe™ proprietary coating treatment assures the sheet won't yellow over time

Keep your name in front of your customers and steer more business your way!

Magnetic printing just got easier with MagneCote® Digital. A special coating has been added to standard MagneCote® Digital that enables the product to withstand the high heat environment within digital print equipment. Now, you can run pre-magnetized product on your mid-range digital platforms for short run, quick turnaround magnet applications. Since the product is pre-magnetized, it is designed to run in small to mid-size digital printers that do not have lengthy conveyance areas where the product can magnetically adhere to conveyance trays. We offer 10 sheet trial packs that enable you a risk free trial of the product, just contact your local merchant or Nekoosa customer service rep for details. Expand your printing opportunities if you are not currently offering magnetic printing or save the hassle of outsourcing magnet jobs by using Digital MagneCote for business cards, calendars, and company contact information. •Like standard MagneCote® Offset, Digital MagneCote is Nexpress certified.
